The Canadian Entomologist.

VOL. XXXI.

LONDON, OCTOBER, 1899.

No. 10.

TABLES FOR THE DETERMINATION OF THE GENERA OF COCCIDÆ.

BY T. D. A. COCKERELL, N. M. AGR. EXP. STA.

SUBFAMILIES.

M	ales with compound eyes
Μ	ales with simple eyes
Ι.	Anal ring with hairs (?)
	Anal ring hairless (?)
2.	Mouth-parts present in adult ♀; legs present in all
	stages
	Mouth-parts absent in adult 2; legs absent in intermediate stage
	of Q
3.	Abdomen of Q terminating in a compound segment; anal orifice
	hairless4.
	Abdomen of 9 not so terminating 5.
4.	Insects with a scale formed entirely of secretionary matter without
	admixture of the exuviæ; adult 2 retaining legs and
	antennæ
	Insects with a scale composed partly of the exuviæ; adult \(\frac{1}{2} \) with-
	out legs
5.	Insects enclosed in a resinous cell with three orifices; adult ?
	apodous, with the terminal segments produced into a tail-like organ,
	bearing at the extremity the anal orifice; a prominent spinelike
	organ above the base of the caudal extension Tachardiina.
,	Not so
6.	Females with the posterior extremity cleft; anal orifice closed above
	by a pair of triangular plates
	Not so; triangular anal plates absent
~	In preparing the above table, I have borrowed in places from that of
Gi	een, Coccidæ of Ceylon, p. 12.

♀ antennæ 8 jointed.....♀ antennæ 4-jointed

	(U	R	T	F	E	Z	1	I	٧,	Æ		Ť						
																			Orthezia, Bosc.*
	,	1		,															Ortheziola, Sulc.
	N	1	2	N	0	P	Н	L	E	В	11	Ñ.	Æ						

- with conspicuous waxy lamellae or processes more or less covering the dorsal surface, but no long ovisac; & unknown... Walkeriana., Sign.
- \circ without a long posterior ovisac, or the lamellæ of Walkeriana....2.
- 2. & abdomen without long fleshy processes Palæococcus, Ckll.
- 3 abdomen with long fleshy processes, usually 8 in num-

There are several other supposed genera in the books. *Crypticerya*, Ckll., is essentially an *Icerya* without an ovisac; in the table it will fall with *Palæococcus*, but having no material of the latter genus, I am not sure whether the two are identical. *C. Townsendi*, var. *plucheæ*, has rows of waxy processes, clearly indicating an approach to the condition of *Walkeriana polei*.

Llaveia, Sign., Ortonia, Sign., Protortonia, Towns., Guerinia, Targ., and Tessarobelus, Mont., seem all to be identical with Monophlebus. Drosicha, Walk., is said to differ from Monophlebus by its 9-jointed antennæ, but it is doubtless an immature form of the latter genus.

The Monophlebinæ are really separable into two distinct tribes: (1) Monophlebini, in which the males have fleshy caudal processes, and the secretion of the females is powdery or cottony, including only Monophlebus; and (2) Iceryini, in which the males have not the fleshy processes, and the secretion of the females is more in the form of waxy plates, including Icerya, Walkeriana, etc.

[†]By the characters given, *Phenacoleachia*, n. g. (type *Leachia zealandica*, Maskell, Tr. N. Z. Inst., XXIII., p. 26), will fall in this subfamily, but it has strongly Dactylopine features. Of this *Phenacoleachia zealandica* I have males, received from Mr. Maskell, and there is a slide of the females, from the same source, in the collection of the U. S. Department of Agriculture. The female resembles that of *Dactylopius*, having two long caudal filaments as in that genus, instead of the brush of *Orthezia*; but it has curious compound eyes consisting of ocelliform bodies forming a single ring round the head, interrupted above and below. The adult female, by its elongated form, elongated mentum, and curved spines at the end of the antennae, resembles *Rhizectus*; but it differs in its 11-jointed antennae (Maskell, l. c., Pl. VI., f. 3). The anal ring bears six stout brigites.

^{*}An overlooked synonym of Orthezia is Cyphoma, Gistel, 1848, Nat. des Thier., p. 151. Type O. characias. (Not Cyphoma, Bolt., 1798).

MARGARODINÆ.

177 17

Trives.
Subterranean; anterior legs of both sexes adapted for
digging
Arboreal; anterior legs normal Xylococcini,
Margarodini,
Includes only Margarodes, Guilding (syn. Porphyrophora, Brandt.).
Xylococcini,
T with no caudal brush
♂ with a caudal brush

Antennæ of adult & 10- or 11-jointed; Australia.. Callipappus, Guèr. CONCHASPINÆ.

1. Antennæ of adult & 9-jointed; temperate region of N. Hemis-

Includes only Conchaspis, Ckll. Ourococcus, Fuller, has not been described; but a specimen of O. casuarinæ received from Mr. Fuller has

a good deal of resemblance, in its caudal structures, to <i>Conchaspis</i> , but is
yet quite distinct from it. The & Ourococcus, very differently from
Conchaspis, has a long glassy tail.
Coccinæ.
Tribes.
Living in galls in Australia; end of abdomen produced into a narrow
tail
Either not living in galls, or end of abdomen not specially modified to
form a tail
1. Q enclosed in a complete sac of waxy or horny texture; skin usually
with figure-of-8 glands; legs absent in adult; larva not fringed
with spines
♀ globular or reniform, in a hard shell; anal ring with hairs in larva,
but not in adult; larva fringed with spines
op not enclosed in a hard shell or waxy or horny sac; or if enclosed
(Porococcus, Cryptoripersia), antennæ and legs present
2. Newly-hatched larva with rows of dorsal spines Eriococcini.
Newly-hatched larva without rows of dorsal spines Dactylopiini.
Brachyscelini,
On Casuarina; larva not fringed with spinesFrenchia, Mask.
On Eucalyptus; larva fringed with spines,

1. Legs all present, but short and unfit for use Apiomorpha, Rūbs. Hind legs only present, these long Opisthoscelis, Schrad. Legs all absent Ascelis, Schrad.
The genus Cystococcus, Fuller, has not yet been sufficiently described
to be included in the tables. It forms spherical galls on Eucalyptus, and
has neither legs nor antennæ.
Asterolecaniini.
Insect with a fringe of glassy rods
Insect without such a fringe
1. Antennæ well-developed in adult 2 Lecaniodiaspis, Targ.
Antennæ rudimentary or absent in adult \$\varphi\$
2. Covering waxy; end of abdomen strongly chitinous Cerococcus, Comst.
Covering horny; end of abdomen not or hardly chitinous; scale
with a caudal process ending with an orifice Solenococcus, Ckll.
(Solenophora, Mask.)
Covering waxy; end of abdomen not chitinous; scale irregular, with
no caudal process
Kermesini.
Contains only one genus, Kermes, Boitard. By the larva, this
appears to be allied to the Eriococcini; whereas the larvæ of the Astero-
lecaniini show them to be allied to the Dactylopiini. Kermes has no
triangular anal plates in any stage, and is not related to the Lecaniinee.
Eriococcini.
Anal ring with hairs
Anal ring without hairs 4.
1. Antennæ and legs absent in adult 2
Antennæ and legs well formed in adult
2. Adult naked to the last Rhizococcus, Sign.
Adult surrounded by cotton, but dorsally naked Gossyparia, Sign.
Adult contained in a hard black scale
Adult living in a gall on oak; antennæ 6 jointed; tarsi 2-jointed;
skin with figure-of-8 glands
Adult forming a cottony sac
3. Anal ring with 8 hairs; caudal lobes long Eriococcus, Targ.§

^{*}I suppose this belongs to *Eriococcini*, but the larval characters are not sufficiently known. The adult is naked, resting on a cushion of cotton, which surrounds it, as in *Gossyparia*, from which it is distinguished by lacking legs and antennæ.

^{\$}The subgenus Thekes, Crawford (type E. eucalypti), has 7-jointed antennæ; those of typical Eriococcus are 6-jointed.

4.	Anal ring with 6 hairs; no caudal lobes
	(Coccus, Sign.)
	Antennæ present, but only one pair of legs5.
	Antennæ and legs absent; not living in a gall; newly-hatched larva
	with four rows of dorsal spines on each side of the middle
	line
5.	Only the hind legs present; skin without grouped glands or truncate
	spines; newly-hatched larva with only one complete row of dorsal
	spines on each side of the middle-line, but one or two other rows
	partially developed anteriorly
	Only the first pair of legs present, these very short; living in a gall;
	newly-hatched larva with two rows of dorsal spines on each side of
	the middle-line; shape of adult elongate, with parallel sides,
	abdomen with long hairs
	Olliffia, Fuller, not yet described, is very close to Eriococcus.
	Dactylopiini.
	nal ring without hairs
	nal ring with hairs
1.	Adult & with all the legs present; first four small, hind pair very
	large; margin with spines
	Adult & with the antennæ minute, conical; legs entirely absent; skin
	with many circular glands
	Adult 9 with the antennæ reduced to a mere tubercle; spiracles
	small; legs absent; skin tuberculate, but without conspicuous
	glands
	(Type P. Marlatti, Ckll.)
2.	With well-formed legs and antennæ in adult
	Legs and antennæ absent or rudimentary in adult15.
3.	Antennæ g-jointed4.
	Antennæ 8- (sometimes 7-) jointed6.
	Antennæ not more than 7-jointed
4	. Anal ring with 8 hairs
	Anal ring with 6 hairs
_	

[†]Type S. inflatipes, Mask., Tr. N. Z. Inst., XXV., p. 238.

5. 9 having the aspect of a Dactylopius Phenococcus, Ckll.
covered with waxy lamellæ, like an Orthezia Ceroputo, Sulc.
6. Insect with large projecting marginal tubercles Tylococcus, Newst.
Without projecting marginal tubercles
7. Anal ring of \mathcal{P} with more than 8 hairs
Anal ring of \mathcal{P} with 6 hairs8.
8. & with four caudal filaments
(so far as known) with only two caudal filaments 9.
9. Body very elongate; antennæ 8-jointed, shorter and stouter than in
Dactylopius; eyes present; mentum short, Pergandiella, Ckll.
(Westwoodia, Sign.)
Body oval, usually with cottony tassel Dactylopius, Costa.
Body subglobular, enclosed in a cottony sac Erium, Crawford.
(Type E. globosum.)
10. Antennæ 6- or 7-jointed; when 7-jointed, distinguished from Dactylo-
pius by the stouter legs and usually subterranean habitat
Antennæ 5-jointed; form elongate; anal tubercles promi-
nent
11. 3 apterous, with relatively short antennæ Fonscolombia, Licht.
(Pseudochermes, Nitsche; Apterococcus, Newst.)
Not so
12. Legs extremely thick, like crab's claws Pseudoripersia, Ckll.
Not so; legs ordinary
13. \mathcal{L} enclosed in a waxy sac
Not so
14. "Antennæ very close together" (Tinsley)Ripersiella, Tinsley.
(R. rumicis and maritima.)
Antennæ normally placed
15. Newly-hatched larva elongate, with 6-jointed antennæ 16.
Newly-hatched larva eval or suboval
16. Terminal antennal segment of newly-hatched larva oval, little longer
than the one before
Terminal antennal segment of newly-hatched larva very large, as
long as the three before
long as the three before

[&]quot;A genus of few species, found in Europe; when the male is unknown, the female is usually referred with safety to the large genus Dactylopius rather than to Oudablis, +Prof. Tinsley has named this genus, and indicated its characters, in a thesis for the degree of B.S., presented to the N. M. Agricultural College, May 31, 1899. He will shortly prepare a paper describing the genus in detail.

TACHARDIINÆ.

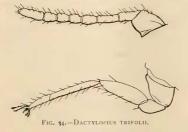

(To be continued.)

THE CLOVER-ROOT MEALY BUG.

Dactylopius trifolii, Forbes.

BY R. H. PETTIT, ASSIST. ENTOMOLOGIST AGR. COLLEGE, MICH.

On July 1, 1893, the writer collected a number of mealy bugs on clover (*Trifolium pratense*) at Ithaca, N. Y. They were found at about the level of the ground between the several stems of the plant, and also on the roots under the soil. On July 17 of this year the same insect was

found on the same plant at Agricultural College, Mich. As they were both supposed to be *D. trifolii*, Forbes, a comparison was made with the original description.*

In this description the insect is credited with having seven joints to the antenna, and as the adult females found here and at Ithaca have eight, the male pupa was examined. This form has seven joints, and

^{* 14}th Rep. of State Entomologist of Ill. for year 1884, by S. A. Forbes.
